## AN ABSOLUTELY FABULOUS LESSON TO TEACH!!!!

## Pythagoras Application

Apparatus: (a shoe box is invaluable!) FOR TEACHER TO TEACH.
Ask this question: $\quad$ Suppose a spider is at $\mathbf{A}$ (the bottom corner of the room). If it wants to crawl to the opposite corner $\mathbf{R}$,
 what is the shortest distance?

Most people will say "Go straight from $\mathbf{A}$ to $\mathbf{C}$, then vertically up to R".

(Some may suggest $\mathbf{A}$ to $\mathbf{P}$, then across the ceiling to R - but this is just the same distance).

Now calculate this distance carefully:

BUT THIS IS NOT THE SHORTEST DISTANCE!

Using the shoe box, cut sides $\mathbf{P A}, \mathbf{S D}, \mathbf{Q B}$ and $\mathbf{R C}$ so that it can lie out flat.

Notice $\mathbf{R}$ has actually split into two separate points, $\mathbf{R}_{1}$ and $\mathbf{R}_{\mathbf{2}}$.

The shortest distance from $\mathbf{A}$ to $\mathbf{R}$ is a straight line....

We will work out $\mathbf{A} \mathbf{R}_{\mathbf{1}}$ and $\mathbf{A} \mathbf{R}_{\mathbf{2}}$ separately.

In $\triangle \mathbf{A B R}_{1}$ :

$$
\begin{aligned}
x^{2} & =(\mathbf{A B})^{2}+\left(\mathbf{B R}_{1}\right)^{2} \\
& =4^{2}+5^{2} \\
& =16+25 \\
& =41 \\
x & \approx 6.4 \mathrm{~m}
\end{aligned}
$$

In $\Delta \mathbf{A B R}_{\mathbf{2}}$ :

$$
\begin{aligned}
\boldsymbol{y}^{2} & =(\mathbf{A Q})^{2}+\left(\mathbf{Q R}_{2}\right)^{2} \\
& =6^{2}+3^{2} \\
& =36+9 \\
& =45 \\
y & \approx 6.7 \mathrm{~m}
\end{aligned}
$$

## Both these are shorter than 7 m (our previous answer).

So the shortest distance is as shown on this diagram:

You should demonstrate this by showing the approximate position along the wall of the classroom (some students still won't believe you).

## Extension:

1) Better pupils could find the position of $\mathbf{T}$ by similar triangles.

$$
\begin{aligned}
& -\frac{z}{4}=-\frac{3}{5} \\
& z=-\frac{12}{5} \\
& z=2.4 \mathrm{~m}
\end{aligned}
$$

2) Find the shortest path of a flying insect ( $\mathbf{A R}$ ), using $\Delta \mathbf{A C R}$

$$
\begin{aligned}
v^{2} & =5^{2}+2^{2} \\
& =25+4 \\
& =29 \\
v & \approx 5.4 \mathrm{~m}
\end{aligned}
$$
