## AN ABSOLUTELY FABULOUS LESSON TO TEACH!!!!

 The RELATIVE SIZES and POSITIONS of EARTH, MOON and SUN.Most people have no idea of the actual size of the numbers involved.
Ask people to draw a SCALE MODEL and they will probably draw something like this:

EARTH
SUN

Here are the approximate numbers:

| Radius of Moon | 1600 km | Moon to Earth | 400000 km |  |
| :--- | :--- | :--- | :--- | :---: |
| Radius of Earth | 6400 km | Earth to Sun | 150000000 km |  |
| Radius of Sun | 700000 km |  |  |  |

Because these numbers are very large, most people do not have the skills to compare them unless we bring them down to scale.
Suppose we let $1 \mathrm{~cm}=1600 \mathrm{~km}$

| Radius of Moon | 1 cm | Moon to Earth | $250 \mathrm{~cm}=2.5 \mathrm{~m}$ |  |
| :--- | :--- | :--- | :--- | :---: |
| Radius of Earth | 4 cm | Earth to Sun | $93750 \mathrm{~cm} \approx 1 \mathrm{Km}!$ |  |
| Radius of Sun | $437.5 \mathrm{~cm} \approx 4.4 \mathrm{~m}$ |  |  |  |

We could fit the 1 cm radius Moon at one end of the white board and the 4 cm radius Earth 2.5 metres away BUT the Sun would be a massive circle 8.8 metres high and a distance of nearly 1 Km away!

Notice that the DISTANCE from the Moon to Earth is less than the RADIUS of the Sun!
Imagining the Earth to be at the centre of the Sun, then the Moon would not even be at the surface of the Sun!
eg

Clearly, it is not possible to make a proper scale model of Moon, Earth and Sun with their correct sizes and distances apart.

The VOLUME of a sphere is $\frac{4 \pi r^{3}}{3}$
The volume of the sun is therefore $\frac{4 \pi(700000)^{3}}{3} \approx 1.436755 \times 10^{18} \mathrm{Km}^{3}$
The volume of the Earth is therefore $\frac{4 \pi(6400)^{3}}{3} \approx 1.098066 \times 10^{12} \mathrm{Km}^{3}$
So to find the number of Earths that would fit into the Sun we simply divide these numbers and obtain: 1308441

In words, a staggering one and a third million Earths would fit inside the Sun.
